

SARDAR PATEL COLLEGE OF ENGINEERING, MUMBAI

END SEMESTER EXAMINATION, JUNE 2022

(Direct Second Year Admission Batch)

S. 4. J. Tech (M) Leus 15

CDAM: SV B Tech (Mechanical) Semester-IV

6/7/22

PROGRAM: SY B.Tech. (Mechanical), Semester-IV
COURSE: PE-BTM403 – Fluid Mechanics

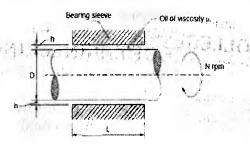

Total points: 100 Duration: 3 HOURS

Note:

- Answer any 5 questions. Each question carries 20 points,
- Answer should be question specific and to the point,
- All component of a question must be answered together,
- Data in the last column represents course outcome and Blooms Taxonomy of respective question.

			CO/BT
Q1.	(A) Derive one dimensional area-velocity relation of a compressible flow as a function of Mach number for a variable area adiabatic flow. Interpret the expression to predict pressure and velocity change under subsonic and supersonic flow condition.	10	7/4
	(B) The pressure , temperature and Mach number at the entry of a flow passage are 2.45bar, 26.5 °C and 1.4 respectively. If the exit Mach number is 2.5. For the adiabatic flow of a perfect gas with γ =1.3 and R=0.469kJ/kg-K, determine a. Stagnation temperature, b. Temperature and velocity of gas at the exit, and c. The flow rate per square meter of the inlet cross-section.	10	7/3,4
Q2.	(A) Derive an expression for the force on a thin plate of given arbitrary shape immersed in a liquid at an angle θ to the free surface. Also find an expression to calculate the centre of pressure.	10	2/3,4
	(B) A wooden cylinder having a specific gravity of 0.6 has a concrete cylinder of the same diameter and 0.2 m length attached to it at one end. The specific gravity of the concrete is 2.5. Determine the length of the wooden cylinder for the composite block to float vertically	10	2/4
Q3.	(A) Write Reynolds Transport Equation and explain the significance of each term involved in the equation. Use it to derive the integral form of the continuity equation.	10	4/1,2
	(B) The distance between the centers of the two arms of a U-tube open to the atmosphere is 25 cm, and the U-tube contains 20-cm-high alcohol in both arms. Now the U-tube is rotated about the left arm at 4.2 rad/s. Determine the elevation difference between the fluid surfaces in the two arms.	10	4/3
Q4.	 (A) (a) Derive expressions from basics for the pressure inside a droplet and a free jet. (b) Define kinematic viscosity and explain the significance of the same. (c) Distinguish between Newtonian and non-Newtonian Fluids. 	10 10	2/2,3 4/3
	(B) A shaft of $D = 80$ mm, gap(h) = 0.1 mm and length of bearing, $L = 0.3$ m as shown in the following figure where a lubricating oil of viscosity 0.1 kg/ms and SG, 0.9 is	10	·

- (B) A shaft of D = 80 mm, gap(h) = 0.1 mm and length of bearing, L = 0.3 m as shown in the following figure where a lubricating oil of viscosity 0.1 kg/ms and SG. 0.9 is used.
- (a) if shaft is moved axially at 0.8 m/s, determine the resistive force offered.
- (b) If shaft is rotated at 1800 rpm, estimate the resistive torque and power required to rotate the shaft.

Q5. Consider following velocity field

$$u = 2x^2 + 3y$$
, $v = -2xy + 3y^2 + 3zy$

$$w = -\frac{3}{2}z^2 + 2xz - 9y^2z$$

What can be concluded about the nature of the possible flow field? Write your comment.

Also calculate following at a point (1,1,1) of the flow field.

- (a) Find the acceleration and vorticity components at for above flow field.
- (b) Shear stress at x-y, y-z and z-x plane.
- **Q6.** (A) What is Couette flow? Mention all assumptions and derive an expression for developed laminar velocity profile for the flow.
- 10 4/2

10

10

6/4

3/3,4

20

5/4

- (B) (a) What is boundary layer? Explain the concept of the displacement and momentum thicknesses.
 - (b) Write Prandtle's boundary layer assumption and derive the equation for it.
- Q7. (A) What is turbulence? What characteristics a turbulent flow has? Write RAN'S 10 5/1,2 equation and explain different terms.
 - (B) There is a 45° bend in the horizontal plane. The inlet area is 1.2 m² and the outlet area is 0.6 m². The velocity of water at inlet is 12 m/s. The pressures at inlet and cutlet are 40 and 30 kPa respectively. Calculate the magnitude and direction of the resultant force on the bend.

SARDAR PATEL COLLEGE OF ENGINEERING, MUMBAI

DEPARTMENT OF MECHANICAL ENGINEERING

END SEMESTER EXAMINATION, MAY 2022

J. Y. S. Fech (Mech) Lem 19/5/22

PROGRAM: SY B. Tech. (Mechanical), Semester-IV

COURSE: PE-BTM403 – Fluid Mechanics

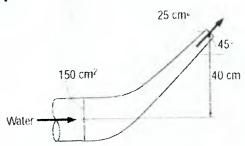

Total points: 600
Duration: 3 HOURS

Note:

- Answer any 5 questions. Each question carries 20 points
- Answer should be question specific and to the point.
- All component of a question must be answered togather.
- Data in the last column represents course outcome and Blooms Taxonomy of respective question

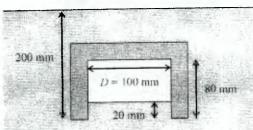

CO/BT 6/2

- Q1. (A) Explain the concept of lift and drag with an illustration. How does the increase in Reynolds number effects the coefficient of drag for flow over a cylinder? Explain it and show its variations graphically.
 - (B) A reducing elbow is used to deflect water flow at a rate of 30 kg/s in a horizontal pipe upward by an angle θ =45° from the flow direction while accelerating it. The elbow discharges water into the atmosphere. The cross sectional area of the elbow is 150 cm² at the inlet and 25 cm² at the exit. The elevation difference between the centers of the exit and the inlet is 40 cm. The mass of the elbow and the water in it is 50 kg. Calculate the anchoring force needed to hold the elbow in place, using **Reynold's Transport Equation**.

- Q2. (A) Derive a general equation of hydrostatics. Assume a container filled with water fall freely from a certain height. Use this equation to predict the variation pressure inside the liquid.

 2/3
 - (B) A cylindrical bowl is inverted symmetrically and held in a dense fluid, SG=15.6, to a depth of 200 mm measured along the centre-line of the bowl from the bowl rim. The bowl height is 80 mm, and the fluid rises 20 mm inside the bowl. The bowl is 100 mm inside diameter, and it is made from an old clay recipe, SG=6.1. The volume of the bowl itself is about 0.9 L. Calculate is the force required to hold it in place?

- **Q3.** (A) Write Navier-Stokes equation for a Newtonian fluid in the differential form. Explain significance of each term in the equation. Simplify it to obtain following
 - · Euler's equation
 - Stoke's equation

SARDAR PATEL COLLEGE OF ENGINEERING, MUMBAI

DEPARTMENT OF MECHANICAL ENGINEERING

RE-EXAMINATION EXAMINATION, JULY 2022 S.Y. A. Tech (muh) Jun IV

PROGRAM: SY B.Tech. (Mechanical), Semester-IV PE-BTM403 - Fluid Mechanics

> Total points: 100 Duration: 3 HOURS

Note:

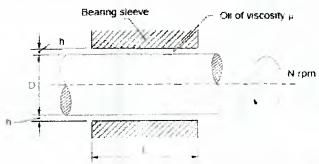

- Answer any 5 questions. Each question carries 20 points
- Answer should be question specific and to the point.
- All component of a question must be answered togather.
- Data in the last column represents course outcome and Blooms Taxonomy of respective question

CO/BT

1/2

10

- (A) Define and explain the following terms. Q1.
 - i) Compressible flow, ii) Mach number, iii) Stagnation state, iv) Critical state, and v) Supersonic flow
 - (B) If D = 80 mm, h = 0.1 mm and L = 0.3 m as shown below, where a lubricating oil 2,3/3 of viscosity 0.1 kg/ms and SG. 0.9 is used.
 - (i) determine the resistive force offered by lubricants if shaft is moved axially at 0.8 m/s.
 - (ii) If shaft is rotated at N=1800 rpm, estimate the resistive torque and power required to rotate the shaft.

- (A) 'The surface tension is an interfacial property of a liquid". Explain it with three 1,2/3,4 different examples. How angle of contact and capillary rise/fall associated to this property? 2/4
 - (B) Following is an approximate boundary layer velocity profile.

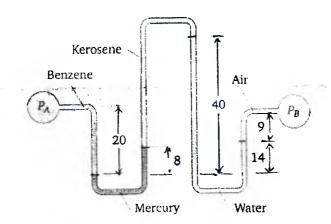

10

 $\frac{u}{U} = 2\frac{y}{\delta} - \left(\frac{y}{\delta}\right)^2$

where U is free stream velocity and remaining terms carries usual meaning. Develop expression for the displacement and momentum thicknesses.

- Q3. (A) Derive differential form of a general continuity equation. Simplify it to obtain 10 1,2/5 continuity equation for (i) a steady flow, (ii) a incompressible flow
 - (B) A multi fluid manometer is used for a certain application where it appears as shown below. Length shown is in centimetres. Specific gravity of Benzene and Kerosene is 0.88 and 0.80 respectively. Predict PB-PA.

10 3/3

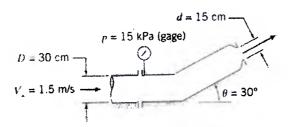

- (A) Differentiate between differential and integral approach of solving a flow 04. problem. Write integral and differential form of mass and momentum equation.
- 10

3,4/3,4

10

(B) Consider flow of water through a pipe bend depicted below geometrical and operating condition. Calculate the resultant force acting on bend and find the direction of action of that force also. Use Reynolds Transport equation. If the bend angle, $\theta=0^{\circ}$, will there be any resultant force acting on the pipe?

- Q5. (A) What is turbulence? List down its characteristics and explain it with suitable examples. Write RANS equation of the turbulent flow.
- 10 2/1,2
- (B) For a given flow field $\vec{V} = 2x \vec{i} yt \vec{j}$ m/s where x and y are in meters and t is in seconds.
- 4/4,5 10

- (i) What is the dimension of flow?
- (ii) Is the flow possible?
- (iii) Find the equation of the streamline passing through (2,-1).
- (iv)Calculate velocity, acceleration, angular velocity and vorticity of flow at a location (1,1,1) and time t=2s.
- Q6. (A) Differentiate between-

10 1,2/4

- i) Lagrangian and Eularian methods of study of fluid flow
- ii) Streamlines and streak lines

2,3/3

10

10

- (B) A wooden cylinder having a specific gravity of 0.6 has a concrete cylinder of the same diameter and 0.2 m length attached to it at one end. The specific gravity of the concrete is 2.5. Determine the length of the wooden cylinder for the composite block to float vertically
- Q7. (A) What are minor and major losses in fluid flow. Provide examples with sufficient explanation.
- 10 1/1,2

2,3/3

- (B) The pressure, temperature and Mach number at the entry of a flow passage are 2.45bar, 26.5 °C and 1.4 respectively. If the exit Mach number is 2.5. For the adiabatic flow of a perfect gas with γ =1.3 and R=0.469kJ/kg-K, determine
 - (i) Stagnation temperature,
 - (ii) Temperature and velocity of gas at the exit, and
 - (iii) The flow rate per square meter of the inlet cross -section.

5B	Re-Examination – July 2022 Examinations Classify ceramics based on application. Explain magnetic ceramics in detail.	06	4	4	4.2.2
5C	Which heat treatment process used to improve the machinability of the annealed hypereutectoid steel? This heat treatment process used cyclic heating around the eutectoid point. Explain it with a schematic diagram.	08	4	2,6	2.2.:
6A	Classify composite based on the type of matrix material. Explain MMC and carbon matrix composite. Differentiate between composite materials and alloy materials.	08	4	4	4.2.
6B	Write a composition of the following materials and their application. 1. Cartridge Brass 2. Muntz metal 3. Deoxidized copper 4. Admiralty gun-metal	06	3,4	3	3.2.
6C	Explain the reason behind the Properties changes when engineering Materials are in Bulk and Fiber Forms. [Note: explain by taking some properties and materials]	06	4	3	3.2.
7A	A FCC crystal yield under a normal stress of 2MPa applied in the $[\overline{1}\ 3\ 2]$ system. The slip system is (111) $[\overline{1}\ 0\ 1]$. Determine critical resolved shear stress. Also draw cubic crystals showing, slip plane and slip direction.	08	2,3	4	3.8.
7B	Discuss the recycling issue in the materials. Suggest other consumer action for minimal environmental impact than just recycling.	07	1,4	6	3.4.2
7C	Find the theoretical density of copper (FCC) assuming the atom to be a hard sphere. The atomic weight of copper is 63.54gm/mole and radius of atom is 1.278 A ⁰ .	05	2	5	3.2.1

(Government Aided Autonomous Institute) Munshi Nagar, Andheri (W) Mumbai – 400058

SY, D. Ties (Meih) Lery (E) ENDSEM- EXAMINATION (DSY) JUNE-2022

4/7/22

Program: MECHANICAL

ICAL Duration: 03 Hours

Course Code: BS-BTM401

Maximum Points: 100

Course Name: APPLIED MATHEMATICS-IV

Semester: IV

• Attempt any five out of seven questions

Use of scientific calculator is allowed.

QN O.	QUESTION	PO IN TS	СО	BL	PI
QI a)	Let X & Y be two independent binomial variates with parameters $(n_1=6,p=1/2)$ and $(n_2=4,p=1/2)$ respectively. Evaluate $P(X+Y)=3$.	06	1	2	2.1.3
QI b)	Find a real root of $2x^3 - 2x - 5 = 0$ by regula-falsi method upto third approximation	06	3	3	1.1.1
QI c)	Verify whether the following functions can be looked upon as probability density function? $f(x) = \frac{1}{2}e^{- x }, -\infty \prec x \prec \infty$	08	1	1	1.1.2
QII a)	The diameters of can tops produced by a machine are normally distributed with standard deviation of 0.01 cms. At what mean diameter the machine be set that not more than 5% of the can tops produced by the machine have diameters exceeding 3 cms?	06	1	2	2.1.4
QII b)	Compute spearman's rank coorelation coefficient for the following data X 10 12 18 18 15 40	06	2	2	2.3.1
QII c)	Verify Stoke's theorem for the vector field $\vec{F} = (2x - y)\hat{i} - yz^2\hat{j} - y^2z\hat{k}$ over the upper half surface of $x^2 + y^2 + z^2 = 1$ bounded by its projection on the XY-plane.	08	2	2	2.3.1
QIII a)	Two bad eggs are mixed accidently with 10 good ones. Find the probability distribution of the number of bad eggs in 3, drawn at random, without replacement from this lot.	06	1	2	1.1.2
QIII b)	The sales-data of an article in six shops before and after a special promotional campaign are as under Shops A B C D E F	06	1	2	1.1.1

Area Under Standard Normal Curve

The table gives the area under the standard normal curve from z=0 to $z=z_1$ which is the probability that z will lie between z=0 and $z=z_1$.

J. Y. A. Tech (mech) Lein IV ENDSEM-REEXAMINATION JULY 2022

Program: MECHANICAL

Duration: 03 Hours

Course Code: BS-BTM401

Maximum Points: 100

Course Name: APPLIED MATHEMATICS-IV

Semester: IV

Attempt any five out of seven questions

Use of scientific calculator is allowed.

DSY End Semester - JUNE 2022 Examinations

5 (A)	A diaphragm pressure gauge is constructed of spring steel to measure differential of 7 MN/m ² . The diameter of diaphragm is 12.5 mm. Calculate the thickness of diaphragm, if the maximum deflection is 0.333 of thickness. Also calculate the natural frequency of diaphragm. Given: Young's modulus=200 GN/m ² , Poisson's ratio-0.28 and density of steel=7800 kg/m ³	10	2	4	4.1.1.
5 (B)	In laboratory mercury in capillary tube temperature measurement system is available. It was proposed to measure humidity present in the laboratory. Explain step-by-step way to measure humidity. Draw appropriate sketches and flow diagram to explain the procedure	10	2	5	3.6.1
6	With neat labeled diagram explain working of (i) optical encoder (ii) stroboscope (iii) eddy current drag-cup tachometer (iv) peizo-electric accelerometer	20	2	3	2.1.2
7(A)	Find the following for a unit step input: Undamped natural frequency, damping ratio, damped natural frequency, settling time (tolerance within	10	4	4	4.1.2
7(B)	2%), peak time, rise time, percentage overshoot. A temperature probe is transferred from air at 25° C to air at 35° C, then to water at 70° C, and back to air at 35° C. Assume that in each case the transfer is "instantaneous". The effective time constants and the timing sequence are as follows: In air, probe dry, $\tau = 30$ s; In water, $\tau = 5$ s; In air, probe wet, $\tau = 20$ s; For $t < 0$, $T = 25^{\circ}$ C (initial temperature) $0 < t < 7$, $T = 35^{\circ}$ C (dry probe in air) $7 < t < 15$, $T = 70^{\circ}$ C (probe in water), $15 < t < 30$, $T = 35^{\circ}$ C (wet probe in air). Calculate the indicated temperature at the end of each time interval and draw approximate graph of temperature versus time at the interval of 2 seconds.	10	3	4	2.1.2

	of the free end. If the changes in gauge resistance is found to be 0.145 Ω ,		1		
	calculate the gauge factor. Deflection of the free end δ= FL ³ /3EI, where F= Force, L=Length, E= Youngs modulus, I=Moment of Inertia, Take				
	Young's modulus for steel as 200x10 ⁹ N/m ²				
3 (B)	Explain working principle of Mcleod gauge with neat diagram. A Mcleod gauge has volume of bulb and measuring capillary equal to 110x10 ⁻⁶ m ³ and measuring capillary diameter of 1.1 mm. (i) Calculate the pressure indicated when the reading of measuring capillary is 28 mm in case approximate formula is used. What is the error if the exact formula is used for pressure measurement?	10	3	2	3.1.1
	A bubbler or purge method is used to measure the water level. Air compressor having pressure range of 0-5 bar is used for the measurement of the water level. Air tube with opening at the bottom of the tank is used to purge the air in the water tank. Operator initially purge the 3 bar pressure in	10	1	2	•
4 (A)	the air tube and no air bubbles are observed. The pressure is varied to maximum rating of 5 bar although no air bubble is observed. In fact at the setting of 5 bar pressure the water rises into the air tube up to 5 meters measured from bottom of the tank. Estimate the water level in the tank from the different observations provided.				2.1.2
4 (B)	Following are the different applications/systems/processes wherein the temperature measurement is essential; (i) Processor of the computing system (ii) Temperature of human beings entering institute campus under COVID-19 pandemic situation. Students shall select the appropriate temperature measuring system for the above applications with justification and also explain their working principle with neat labelled sketches. (Note: Points will be assigned to explanation only if selection of system is appropriate).	10	4	6	3.8.1
5 (A)	A diaphragm pressure gauge is constructed of spring steel to measure differential of 7 MN/m ² . The diameter of diaphragm is 12.5 mm. Calculate the thickness of diaphragm, if the maximum deflection is 0.333 of thickness. Also calculate the natural frequency of diaphragm. Given: Young's modulus=200 GN/m ² , Poisson's ratio-0.28 and density of steel=7800 kg/m ³	10	2	4	4.1.1.
5 (B)	In laboratory mercury in capillary tube temperature measurement system is available. It was proposed to measure humidity present in the laboratory. Explain step-by-step way to measure humidity. Draw appropriate sketches and flow diagram to explain the procedure	10	2	5	3.6.1

END SEM EXAMINATIONS (Even SEM) May 2022

S. y. B. Tell Lem IV (Muly)

Program:

BTech Mechanical engg

Duration: 3.00 hr

Course Code: PC-BTM412

Maximum Points: 100

Course Name: Kinematics of Machinery

Semester: IV

Notes:

1. Question number ONE is compulsory solve any four out of remaining

2. Question nos. two and three should be solved on drawing sheet.

3. Answers to each sub-questions are grouped together

4. Use of scientific calculator is allowed

5. Begin answer to each question on new page.

6. Candidates should write the answer legibly

Q.No.	Questions	Pts	Cos	BL	PI
1	a) Define the following terms, illustrating with sketches where possible, element or link, lower pair, higher pair, kinematic chain.b) Describe with neat sketch a quick return motion mechanism (slotted lever-crank) suitable for shaping machine. Show how the ratio of time taken for the two strokes is determined?	4x5	1 2 3 4	2,3	2.4.
	 c) Sketch the Davis steering gear mechanism and show that it satisfies the required condition for correct steering. d) Sketch and describe different types of followers which are used with radial or disc cam. e) Explain the meaning of the following terms: circular pitch, diametral pitch, module, pressure angle. Illustrate with sketches where possible. 		*		
2	 a) A crank-rocker linkage has a 100 mm frame, a 25 mm crank, a 90 mm coupler and a 75 mm rocker. For the given mechanism find the minimum and maximum transmission angle. Sketch both the toggle position and find corresponding crank angles and transmission angles. (Solve graphically). b) For the above given mechanism, find the angular velocities of coupler and follower in terms of input angular velocity of crank as ω, for the configuration of minimum and maximum transmission angle. (Use IC method) 	12	1	3,4	2.3.

3	a) Use following data in drawing the displacement, velocity, acceleration verses theta (θ) diagram for a cam in which a knife-edged follower is	14	4	3	2.3.
	raised with UARM and is lowered with SHM: least radius of cam 60 mm, lift 45 mm, angle of ascent 60°, angle of descent 75°, dwell				-
	between ascent and descent 40°, cam rotation 180 rpm. Determine the maximum velocity and acceleration during ascent and descent.	ne			
	b) Deduce the expression for displacement, velocity and acceleration of the follower when it moves with SHM.	6			
4	a) State the fundamental law of gearing, deduce the expression for the same.	6	4	3	2.3.
	b) A gear set with a module of 5 mm/tooth has involute teeth with 22.5° pressure angle, and has 19 and 31 teeth, respectively. They have 1.0m for the addendum and 1.5m for the dedendum. (In SI. tooth system modules are given in, m, and a = 1.0m means 1 module, not 1 meter). Tabulate the addendum, dedendum, clearance, circular pitch, base pitch, base circle radius, contact ratio, angle of action for the pinion and wheel.	14			
5	a) A spur gears with 9 and 36 teeth are to be cut with 20° full-depth cutter	10	4	4	2.2.
	 with module of 8 mm. i. Determine the amount that the addendum of the gear must be decreased in order to avoid the interference. ii. If the addendum of the pinion is increased by the same amount, determine the contact ratio. 				3
	b) Deduce the expression for minimum number of teeth on gear wheel.	10			
6	 a) State the advantages of gear drive over the belt drive. b) What is interference in gear? How it is avoided? c) Define kinematic pair, classify the same. d) State and explain Kennedy's theorem. e) State and prove condition for correct steering. 	20	4 4 2 2 2 2	2	2.3.
7	a) State the conditions for straight line generating mechanism. Sketch the Peaucellier mechanism and prove that the tracing point 'P' describes the straight line.		2	3	2.3.
	b) A driving shaft of a Hooke's joint rotates at a uniform speed of 400 rpm. If the maximum variation in the driven shaft is ±5% of the mean speed, determine the greatest permissible angle between the axes of the shafts. What are the maximum and minimum speeds of the driven shaft?

1715/2

Program: B.Tech. in Mechanical Engineering

Course Code: PC-BTM415

Course Name: Solid Mechanics

Duration: 3 Hour

Max. Points: 100

Semester: IV

Notes:

1. Question no. 1 is compulsory, solve any 4 of remaining 6 questions.

2. 'a' is the single last digit (0 to 9) of student's registration no. in questions marked with *.

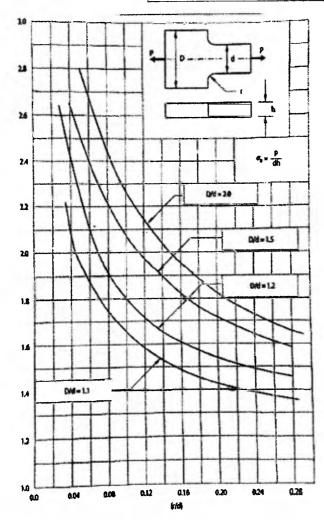

3. Assume suitable data if necessary.

Q. No.	Questions	Points	СО	BL	PI
SORY O	A) * Given the stress matrix τ_{ij} , determine the magni- $\tau_{ij} = \begin{bmatrix} -1 & 1 & -2-a \\ 1 & 1+a & 3 \\ -2-a & 3 & -1 \end{bmatrix}$ a plane parallel to x axis and equally inclined to y and z planes.	(5)	1	3	2.4.1
COMPULSORY	B) Derive following expression for an isotropic linear elastic material: $\sigma_3 = \lambda(\varepsilon_1 + \varepsilon_2 + \varepsilon_3) + 2\mu\varepsilon_3$ where $\sigma_1, \sigma_2, \sigma_3$ and $\varepsilon_1, \varepsilon_2, \varepsilon_3$ are the principal stresses and strains and λ, μ are Lame's coefficients. Highlight the step in the derivation which is based on material isotropy.	(5)	3	4	2.3.1
	C) * A flat plate as shown in the figure is made of material with ultimate tensile strength of 500 MPa. Calculate the safe load it can carry with factor of safety as 2.0.	(5)	3	3	2.1.2
	D) * A bar of steel 2 meters long, is 20 mm in diameter for 1000 mm of its length, 10 mm in diameter for the remaining 1000 mm. The bar is in tension, the stress in the largest section being $(100 + 10 \times a)$ MPa. Taking E = 200 GPa, find the energy stored in the bar.	(5)	4	3	2.2.3
Q2	A) * The rectangular components of small strain at a point is given by the following matrix. Determine the principal strains and the direction of maximum principal strain. $(p = 10^{-4})$	(10)	1	3	2.4.1

	$\begin{bmatrix} \varepsilon_{ij} \end{bmatrix} = p \begin{bmatrix} 1 & 2 & 0 \\ 2 & 1 + \boldsymbol{a} & -2 \\ 0 & -2 & 2 \end{bmatrix}$ B) * A 50 mm long steel rod of $(25+\boldsymbol{a})$ mm diameter is pressed on to a steel plate with a force of $(10+\boldsymbol{a})$ N. Consider E = 200 GPa, $\nu = 0.3$. Determine following. i. The width of the contact area	(5)	2	3	2.3.1
	ii. The maximum contact pressure				
A de Valente e de des mandaments en en constitution de des des des des des des des des des	 iii. The maximum shear stress on the contact surface iv. The maximum shear stress below the surface of contact. C) Give two cases from real life where theory of metal plasticity is essential to analyze the cases. Describe the Bauschinger effect with 	(5)	3	3	2.1.2
	the help of load vs displacement plot.	/#\	<u></u>	2	212
Q3	A) Compare between 'plane stress' and 'plane strain' problems. Give	(5)	3	2	2.1.2
	one example of each type of the problem. What is the advantage of				
	this concept?				
	B) One of the differential equations of equilibrium is	(5)	3	4	2.3.1
	$\frac{\partial \tau_{xy}}{\partial x} + \frac{\partial \sigma_y}{\partial y} + \frac{\partial \tau_{yz}}{\partial z} + \gamma_y = 0$			4	2.3.1
5	,				
	Derive above equation. (Hint: use force equilibrium for a cubicle element along a coordinate axis).				
	C) * A thick-walled cylinder has an internal radius of (50+a) mm and	(10)	2	3	2.2.3
	an external radius of $(100+a)$ mm. It is subjected to external pres-	(10)			2.2.3
ĺ	sure of 1 MPa. If $E = 200$ GPa and $E = 0.3$, determine the permissible				
	internal pressure as per Maximum Principal stress theory of failure.		ĺ		
	Consider tensile strength as 50 MPa and factor of safety as 2.0. Also			! !	
	determine the changes in internal and external radii.				
Q4	A) * Collar D of 1 kg mass is	(10)	4	3	2.3.1
	released from rest in the				
	position shown in the righte and				
	it is stopped by a small plate				
	attached at end C of the vertical rod ABC. Section AB is of 10				
	mm diameter and section BC is				
	of 5 mm diameter. E = 200 GPa.				
	Determine the instantaneous				
. towards	stresses in the rod.			Salas	
	B) Explain why stress is termed as	(5)	1	2	2.3.2
	a tensor entity. Discuss the				
	difference between "stress $(0.5 + 0.1 \times a)$ m				
	tensor" and "stress vector" at a				
	point.		3	2	2.1.3
	C) Discuss the following: (i) nature of constitutive equations which	(5)	,	_	2.1.3
	relate the stress and strain for a material, (ii) True stress and strain versus Engineering stress and strain.				
	versus Engineering suces and ottain.		4	L	

Q5	A) * The displacement field for a body is given by:	(5)	2	3	2.4.1
	$\bar{u} = [((a+1)x^2z + y^2)\bar{\iota} + ((a+2)yz^2)\bar{\jmath} + (6xy^3z)\bar{k}]10^{-4}$				
	What are the strain components at (-1, 1, -1)?				
	B) Explain the principle of superimposition. Prove the uniqueness	(5)	3		221
	theorem for elastic bodies using the principle of superimposition.	, ,	3	4	2.3.1
	C) * A steel disk of (500+a) mm diameter is shrunk on a steel shaft of	(4.0)			
	50 mm diameter. The interference on diameter is 0.025 mm. Find	(10)	2	3	2.2.3
	the rotation speed at which contact pressure is zero. Also calculate				
	the maximum tangential stress at above speed. Consider $E = 200$				
Q6	GPa, = 0.3 and density = 7850 kg/m ³ . A) * State Cauchy's stress formula. Solve the following problem using	(10)	3	4	2.3.1
Qo	the formula.	(10)		7	2.3.1
	The state of stress at a point is characterized by the matrix shown.				İ
	Determine σ_{12} such that there is at least a single plane passing				
	throught the point in such a way that the resultant stress on that				
	plane is zero. Determine the direction cosines of the normal to that				
	plane.				
	$\begin{bmatrix} -1 & \sigma_{12} & (1+a) \end{bmatrix}$				
	$egin{bmatrix} \left[au_{ij} ight] = egin{bmatrix} -1 & \sigma_{12} & (1+m{a}) \ 2 & 1 & 3 \ (1+m{a}) & 3 & -1 \end{bmatrix}$				
	· ·				222
	B) Discuss significance of following terms in solid mechanics: (i)	(5)	2	2	2.3.2
	Principal strain, (ii) compatibility equations, (iii) strain gauges C) * A thin-walled rectangular box section has the mean width and				
	height of $(20+a)$ mm and $(40+a)$ mm respectively. The wall thick-	(5)	2	3	2.3.1
	ness is 1 mm. It is subjected to torque of 10 Nm. Calculate the shear				
	stress in the wall and the angle of twist per unit length. $G = 80$ GPa.				
Q7	A) Give two examples from real life about the thermoelastic problems.	(5)	2	3	2.3.2
	Write the stress-strain relationship for these problems. Prove that if				
	a body is uniformly heated, the stresses induced are zero.				
	B) Explain the following: (i) resilience, (ii) proof resilience, (iii) strain	(5)	4	2	2.3.2
	energy, (iv) strain energy density, (v) difference between gradually	(3)			
	applied and suddenly applied loading.				
	C) Discuss three modes of fracture and give two examples from real life for each mode.	(5)	3	3	2.3.2
	D) * A rectangular plate of 50 mm width and thickness 25 mm has an			1	
	edge crack of $(3 + 0.1 \times a)$ mm depth. The plate is subjected to an	(5)	3	3	2.3.1
	axial load of 10 kN and a bending moment of 2000 Nm both of				
	which tend to open the crack. The fracture toughness of the plate				
	material is $50 MPa\sqrt{m}$. Calculate the factor of safety against the				
	fracture failure.				

ANNEXURE: USEFUL FORMULAE

Stresses for two cylinders in contact with each other

$$b = \sqrt{\frac{2F}{\pi l} \left[\frac{(1 - v_1^2)}{E_1} + \frac{(1 - v_2^2)}{E_2} \right]}$$

$$p_{max} = \frac{2}{\pi} \frac{F}{bl}$$

$$\sigma_{x} = -2\nu p_{max} \left[\sqrt{\left(1 + \frac{z^{2}}{b^{2}}\right)} - \frac{z}{b} \right]$$

$$\sigma_y = -p_{max} \left[\left(2 - \frac{1}{1 + z^2/b^2} \right) \sqrt{1 + z^2/b^2} - 2 \frac{z}{b} \right]$$

$$\sigma_z = -p_{max} \left[\frac{1}{\sqrt{1 + z^2/b^2}} \right]$$

Stresses in thick pressurized cylinders

$$\sigma_r = \frac{p_a a^2 - p_b b^2}{h^2 - a^2} - \frac{a^2 b^2}{r^2} \times \frac{p_a - p_b}{h^2 - a^2}$$

$$\sigma_{\theta} = \frac{p_a a^2 - p_b b^2}{h^2 - a^2} + \frac{a^2 b^2}{r^2} \times \frac{p_a - p_b}{h^2 - a^2}$$

$$\sigma_z = 0$$
 with both ends open

$$\sigma_z = v(\sigma_r + \sigma_\theta)$$
 with both ends closed

Stresses in rotating solid disks

$$\sigma_r = \frac{3+\nu}{8}\rho\omega^2(b^2 - r^2)$$

$$\sigma_\theta = \frac{3+\nu}{8}\rho\omega^2b^2 - \frac{1+3\nu}{8}\rho\omega^2r^2$$

$$\sigma_r = \frac{3+\nu}{8}\rho\omega^2 \left(b^2 + a^2 - \frac{a^2b^2}{r^2} - r^2\right)$$

$$\sigma_\theta = \frac{3+\nu}{8}\rho\omega^2 \left(b^2 + a^2 + \frac{a^2b^2}{r^2} - \frac{1+3\nu}{3+\nu}r^2\right)$$

SIF for edge cracked plate subjected to axial load P / bending moment M

$$(K_I)_P = \frac{P}{Bh} \sqrt{\pi a} \, Y_P \; ,$$

$$Y_P = 1.12 - 0.23\alpha + 10.55\alpha^2 - 21.72\alpha^3 + 30.39\alpha^4; \ \alpha = \alpha/h$$

Course Name: Solid Mechanics

1577/2 Semester: IV

Notes:

1. Question no. 1 is compulsory, solve any 4 of remaining 6 questions.

2. 'a' is the single last digit (0 to 9) of student's registration no. in questions marked with *.

3. Assume suitable data if necessary.

Q. No.	Questions	Points	СО	BL	PI
Q1	A) Briefly explain the physical meaning of the compatibility equations. Two of the compatibility equations are given below.	(5)	2	3	2.3.1
COMPULSORY	$\frac{\partial^{2} \varepsilon_{x}}{\partial y^{2}} + \frac{\partial^{2} \varepsilon_{y}}{\partial x^{2}} = \frac{\partial^{2} \gamma_{xy}}{\partial x \partial y}$ $\frac{\partial}{\partial z} \left(\frac{\partial \gamma_{yz}}{\partial x} + \frac{\partial \gamma_{xz}}{\partial y} - \frac{\partial \gamma_{xy}}{\partial z} \right) = 2 \frac{\partial^{2} \varepsilon_{z}}{\partial x \partial y}$				
CON	Check if the above equations satisfy the following strain field (p is a constant of small value). $\begin{bmatrix} \varepsilon_{ij} \end{bmatrix} = p \begin{bmatrix} x & y & x \\ y & y & (x+y) \\ x & (x+y) & 2(y+z) \end{bmatrix}$				
				,	2 / /
	determine: Magnitude of the normal and shear stress on a plane which has its normal $\tau_{ij} = \begin{bmatrix} a-1 & a+3 & 10 \\ a+3 & 1 & 1 \\ 10 & 1 & -1 \end{bmatrix}$	(5)		3	2.4.1
	which is inclined to the x axis by 60 degrees and is inclined to the y axis also by 60 degrees.				
	C) Describe the three modes of fracture with neat sketch. Give two examples of each mode from real life situations.	(5)	2	2	2.3.2
	D) * Two 20 mm long steel rods of $(20+a)$ mm diameter are pressed against each other with a force of $(80+a)$ N. Consider E = 210 GPa, $\nu = 0.3$. Determine following.	(5)	2	3	2.3.1
	i. The width of the contact areaii. The maximum contact pressure				
	iii. The maximum shear stress on the contact surface				
	iv. The maximum shear stress below the surface of contact.				

Q2	A) A thick-walled pipe has internal radius of (100+a) mm. It is sub-	(10)	2	3	2.2.3
	jected to internal pressure of 2.0 MPa and external pressure of 0.25 MPa. If $E = 200$ GPa and $v = 0.3$, determine the thickness as per				
	the maximum principal stress theory of failure. Consider tensile				
	strength as 350 MPa and factor of safety as 3.5. Also determine the				
	changes in internal and external radii for the pipe with the calcu-				
	lated thickness.				
	B) A rectangular bar with transverse hole is subjected to bending mo-	(5)	2	3	2.2.3
	ment. The geometry parameters and the stress concentration factor				
	for the bar are as shown in the figure.

	Derive above equation.		4	3	2.3.1
	B) * Block D of 10 kg mass is released	(10)	4		2.3.1
	from rest in the position shown in the				
	figure and it is stopped by a cover plate $(1.0 + 0.1 \times a)$ m				
	attached at end A of the vertical rod				
	ABC which is fixed at end C. Section				
111	AB is of 12 mm diameter and section				
	BC is of 6 mm diameter. E = 200 GPa.				
	Determine the instantaneous stresses in				
	the rod.				
	C) Why are the plane stress and plane	(5)	1	2	2.1.2
	strain approximations used to solve			_	
	certain elasticity problems? Give two examples of each type. Compare the				
	difference between these two				ĺ
	approaches.				
Q5	A) * The rectangular components of stress at a point are given by the	(10)	1	3	2.4.1
4.	following matrix. Determine the principal stresses and the direction				
	of the maximum principal stress.				
	$\begin{bmatrix} a-10 & 1 & 2 \end{bmatrix}$				
	$[\tau_{ij}] = \begin{bmatrix} a - 10 & 1 & 2 \\ 1 & 3 & -1 \\ 2 & -1 & 5 \end{bmatrix}$				
	Driefly discuss the importance of principal etrasses in the design of		1		
	Briefly discuss the importance of principal stresses in the design of machine components.				
	B) * A rotor of (400+a) mm diameter is shrunk fitted on a steel shaft		1		
	of 60 mm diameter. The interference on diameter is 0.02 mm. Find	(10)	2	3	2.2.3
	the rotation speed at which contact pressure is zero. Also calculate				
	the maximum tangential stress at the calculated speed. Consider E				
	= 200 GPa, $\nu = 0.3$ and density = 8000 kg/m ³ .				
Q6	A) * The displacement field for a body is given by:	(5)	2	3	2.4.1
Ųυ	$\bar{u} = [(yz^2 + (a-10)xy^2z)\bar{\iota} + ((a+2)xyz)\bar{\jmath} + (x^3y^3 + z^2)\bar{k}]10^{-5}$				
	What are the strain components at $(1, -1, 1)$?				
	B) Discuss the importance of the constitutive equations in solid	(E)			
	mechanics. Explain how the nature of these equations change for	(5)	3	2	2.1.3
	i incentifies, explain now the nature of these equations entinge for	İ		1	
	the isotropic and anisotropic materials.		4	1	1

	C) * A thin-walled box section of uniform wall thickness 2 mm has a triangular shape as shown in the figure. The section is subjected to a torque of 25 Nm. Calculate the shear stress induced in the section and the angle of twist per unit length. Consider G = 80 GPa.	(5)	2	3	2.4.2
	D) * A rectangular plate of 80 mm width and thickness 40 mm has an edge crack of $(10 + 0.1 \times a)$ mm depth. The plate is subjected to an axial load of 25 kN and a bending moment of 2500 Nm both of which tend to open the crack. The fracture toughness of the plate material is $75 MPa\sqrt{m}$. Calculate the factor of safety against the fracture failure.	(5)	3	3	2.3.1
Q7	A) Describe the relation between the true and engineering stress/strain. Discuss the need of these concepts in engineering analysis.	(5)	3	2	2.1.3
The Company	B) What is the uniqueness theorem? Provide a proof for this theorem. C) Discuss how temperature loading is accounted for in the stress-	(5)	3	4	2.3.1
	strain relationship. Obtain the stresses for a case wherein an unconstrained solid is uniformly heated.	(5)	2	2	2.3.2
	D) Prove that the strain energy stored in a hollow cylinder of length L , polar area moment of intertia J and subjected to torque T is given by $U = \frac{T^2L}{2JG}$.	(5)	3	3	2.3.2

ANNEXURE: USEFUL FORMULAE

Stresses for two cylinders in contact with each other

$$b = \sqrt{\frac{2F}{\pi l} \left[\frac{(1 - v_1^2)}{\frac{E_1}{d_1} + \frac{(1 - v_2^2)}{E_2}} \right]}$$

$$p_{max} = \frac{2}{\pi} \frac{F}{bl}$$

$$\sigma_x = -2\nu p_{max} \left[\sqrt{\left(1 + \frac{z^2}{b^2}\right)} - \frac{z}{b} \right]$$

$$\sigma_y = -p_{max} \left[\left(2 - \frac{1}{1 + z^2/b^2} \right) \sqrt{1 + z^2/b^2} - 2 \frac{z}{b} \right]$$

$$\sigma_{z} = -p_{max} \left[\frac{1}{\sqrt{1+z^{2}/b^{2}}} \right]$$

Stresses in thick pressurized cylinders

$$\sigma_r = \frac{p_a a^2 - p_b b^2}{h^2 - a^2} - \frac{a^2 b^2}{r^2} \times \frac{p_a - p_b}{h^2 - a^2}$$

$$\sigma_{\theta} = \frac{p_a a^2 - p_b b^2}{h^2 - a^2} + \frac{a^2 b^2}{r^2} \times \frac{p_a - p_b}{h^2 - a^2}$$

 $\sigma_z = 0$ with both ends open

$$\sigma_z = \nu(\sigma_r + \sigma_\theta)$$
 with both ends closed

END-SEMESTER - RE-EXAMINATION - JULY 2022

Program: B.Tech. in Mechanical Engineering

Course Code: PC-BTM415

Course Name: Solid Mechanics

Duration: 3 Hour

Max. Points: 100

Semester: IV

Notes:

1. Question no. 1 is compulsory, solve any 4 of remaining 6 questions.

2. 'a' is the single last digit (0 to 9) of student's registration no. in questions marked with *.

3. Assume suitable data if necessary.

Q. No.	Questions	Points	СО	BL	PI
COMPULSORY	A) Figure shows a solid element located inside a stressed body and defined in a cylindrical coordinate system. To derive one of the equilibrium equations, it is required to compute all forces acting on this element in r-direction due to stresses acting on its six faces and the body force. Obtain the expressions for the forces acting in r-direction on the two	(5)	3	4	2.3.1
	faces abcd and a'b'c'd' and for the body force acting on the element in r-direction. B) * A notched rectangular bar as shown in the figure is subjected to tensile force $F = (1000 + 10 \times a)$ N. The dimensions of the bar are $w - 12$ mm, $d = 10$ mm, $r = 1$ mm, thickness $= 2$	(5)	3	3	2.1.2
	mm. Calculate the maximum stress induced in the bar. C) * Given the stress matrix $\tau_{ij}, determine the magnitude of the normal and shear stress on a plane paragraph of the paragraph of t$	(5)	1	3	2.4.1
	allel to z axis and equally inclined to x and y axes. D) Discuss the significance of the following terms in the energy-based approach of solid mechanics: (i) strain energy, (ii) strain energy density, (iii) resilience, (iv) proof resilience. Give two examples from real life where the energy-based approach is more suitable for calculating the stresses/strains.	(5)	4	3	2.1.2

Q2 A) * The matrix representation of the stress state at a point is given by	(10)	1	3	2.4.1
the following matrix. Determine the principal stresses and the				
direction of the minimum principal stress.	,			
$\begin{bmatrix} a+1 & 5 & -1 \\ 5 & 10 & a & 1 \end{bmatrix}$				
$[\tau_{ij}] = \begin{bmatrix} a+1 & 5 & -1 \\ 5 & 10-a & 1 \\ -1 & 1 & 2 \end{bmatrix}$				
How are the principal stresses related to the design of machine com-				
ponents?				
B) * A thick-walled cylindrical vessel has an internal radius of	(10)	2	3	2.2.3
(1000+a) mm and an external radius of $(1050+a)$ mm. It is sub-	(10)	2	,	2.2.3
jected to the internal pressure of 10 MPa. If $E = 200$ GPa and $= 0.3$,	i			
determine the permissible external pressure as per the Maximum				
Principal stress theory of failure. Consider tensile strength as 200				
MPa and factor of safety as 2.0. Also determine the changes in in-				
ternal and external radii.	(5)	2	3	2.4.1
Q3 A) * The displacement field for a body is given by:	(3)	2	,	2.7.1
$\bar{u} = [((a-10)xyz + x^2)\bar{\iota} + (y^2 + xz^2)\bar{\jmath} + ((1+a)xz^3)\bar{k}]10^{-4}$				
What are the strain components at $(1, 1, 1)$?		2	3	2.3.1
B) * Two cylindrical rollers of $(50+a)$ mm diameter and $(30+a)$ mm	(5)	2	3	2.3.1
length are pressed against each other with a force of $(100+a)$ N.				
Consider E = 200 GPa, ν = 0.3. Determine following.				
i. The width of the contact area				
ii. The maximum contact pressure				
iii. The maximum shear stress on the contact surface iv. The maximum shear stress below the surface of contact.				
	1		-	
C) * Collar S of 2 kg mass is re- leased from rest in the position	(10)	4	3	2.3.1
shown in the figure and it is				
stopped by a small plate at-				
tached at end R of the vertical				
PQR. The rod is fixed at P .				
Section PQ is of 10 mm diame-		- 18		
ter and section QR is of 15 mm				
diameter, E = 200 GPa. Deter-				
mine the instantaneous stresses				
in the rod.				*
R				
$(2.0 + 0.1 \times a) \text{ m}$				
Q4 A) * A rotor of (600+a) mm diameter is shrunk fitted on a steel shaft	(10)	2	3	2.2.3
of 80 mm diameter. The interference on diameter is 0.03 mm. Find	, ,			
the rotation speed at which contact pressure is zero. Also calculate				
the maximum tangential stress at the calculated speed. Consider E				
$= 210 \text{ GPa}, \nu = 0.3 \text{ and density} = 7800 \text{ kg/m}^3.$				
B) Thermoelastic problems are important in design of machine	(5)	2	3	2.3.2
components. Discuss the nature of thermoelastic problems with				

	two examples from real life and state the stress-strain relationship for these problems. Develop the expression for stresses for stresses in a body which is uniformly heated. C) What are the three modes of fracture in solid bodies? Which mode	(5)	3	3	2.3.2
	is the most common? Provide two examples from real life for each				
Q5	mode. A) Discuss significance of following terms in solid mechanics: (i)	(5)	2	2	2.3.2
QJ	Compatibility equations, (ii) Strain-displacement equations, (iii) strain gauges.	(0)			
	B) State the 'superposition principle' and 'uniqueness theorem'. Provide an outline of proving the uniqueness theorem form the superposition principle.	(5)	3	4	2.3.1
	C) * A thin-walled box section is of rectangular shape; it has the mean width and height of (30+a) mm and (50+a) mm respectively. The wall thickness is 2 mm. It is subjected to torque of 40 Nm. Calculate the shear stress in the wall and the angle of twist per unit length. G = 82 GPa.	(5)	2	3	2.4.2
	D) Explain the Bauschinger effect in the context of metal plasticity.	(5)	3	3	2.1.2
Q6	A) Explain the following: (i) shear flow, (ii) stress concentration factor, (iii) stress intensity factor, (iv) stress tensor.	(5)	2	3	2.1.2
Total of Control	B) The Lame's coefficients λ , μ for an isotropic linear elastic material are defined as: $\sigma_3 = \lambda(\varepsilon_1 + \varepsilon_2 + \varepsilon_3) + 2\mu\varepsilon_3$ where σ_1 , σ_2 , σ_3 and ε_1 , ε_2 , ε_3 are the principal stresses and strains. Derive these expressions.	(5)	3	4	2.3.1
	 C) Discuss the plane stress and plane strain approximations. Compare between these approaches with two examples of each type. D) * A bar of steel 1 meters long, is 50 mm in diameter for 250 mm of 	(5)	1	2	2.1.2
	its length, 20 mm in diameter for the remaining 750 mm. The bar is in compression, the stress in the smallest section being $(200 + 10 \times a)$ MPa. Taking E = 200 GPa, find the energy stored in the bar.	(5)	4	3	2.2.3
Q7	A) Derive the following equation of equilibrium.	(5)	3	4	2.3.1
	$\frac{\partial \sigma_x}{\partial x} + \frac{\partial \tau_{xy}}{\partial y} + \frac{\partial \tau_{xz}}{\partial z} + \gamma_x = 0$			The state of the s	
	B) Derive the following compatibility equation. Hint: Begin with the strain-displacement relationship for ε_x and ε_y . $\frac{\partial^2 \varepsilon_x}{\partial y^2} + \frac{\partial^2 \varepsilon_y}{\partial x^2} = \frac{\partial^2 \gamma_{xy}}{\partial x \partial y}$	(5)	2	3	2.3.1
	C) Describe the nature and the need of the constitutive equations. Illustrate the typical form of these equations for the isotropic and anisotropic materials.	(5)	3	2	2.1.3
	D) Discuss the metal plasticity and provide suitable examples where it plays an important role in design of certain components. What is the significance of Deviatoric or π plane and Yield locus in the plasticity analysis?	(5)	3	3	2.1.2

ANNEXURE: USEFUL FORMULAE

Annexure 1

Stresses for two cylinders in contact with each other

$$p_{max} = \frac{2}{\pi} \frac{F}{bl}$$

$$b = \sqrt{\frac{2F}{\pi l} \left[\frac{(1 - v_1^2)}{E_1} + \frac{(1 - v_2^2)}{E_2} \right]}$$

$$\sigma_{x} = -2\nu p_{max} \left[\sqrt{\left(1 + \frac{z^{2}}{b^{2}}\right)} - \frac{z}{b} \right]$$

$$\sigma_{y} = -p_{max} \left[\left(2 - \frac{1}{1 + z^{2}/b^{2}} \right) \sqrt{1 + z^{2}/b^{2}} - 2 \frac{z}{b} \right]$$

$$\sigma_z = -p_{max} \left[\frac{1}{\sqrt{1 + z^2/b^2}} \right]$$

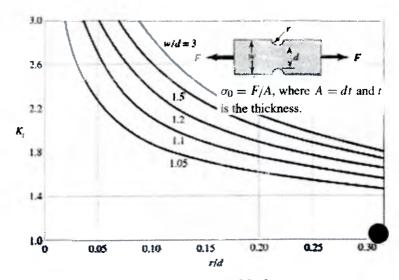

Stresses in thick pressurized cylinders

$$\sigma_r = \frac{p_a a^2 - p_b b^2}{b^2 - a^2} - \frac{a^2 b^2}{r^2} \times \frac{p_a - p_b}{b^2 - a^2}$$

$$\sigma_{\theta} = \frac{p_a a^2 - p_b b^2}{h^2 - a^2} + \frac{a^2 b^2}{r^2} \times \frac{p_a - p_b}{h^2 - a^2}$$

 $\sigma_z = 0$ with both ends open

 $\sigma_z = \nu(\sigma_r + \sigma_\theta)$ with both ends closed

Stresses in rotating solid disks

$$\sigma_r = \frac{3+\nu}{8}\rho\omega^2(b^2 - r^2)$$

$$\sigma_\theta = \frac{3+\nu}{8}\rho\omega^2b^2 - \frac{1+3\nu}{8}\rho\omega^2r^2$$

$$\sigma_r = \frac{3+\nu}{8} \rho \omega^2 \left(b^2 + a^2 - \frac{a^2 b^2}{r^2} - r^2 \right)$$

$$\sigma_\theta = \frac{3+\nu}{8} \rho \omega^2 \left(b^2 + a^2 + \frac{a^2 b^2}{r^2} - \frac{1+3\nu}{3+\nu} r^2 \right)$$

SIF for edge cracked plate subjected to axial load P / bending moment M

$$(K_I)_P = \frac{P}{Bh} \sqrt{\pi a} Y_P .$$

$$Y_P = 1.12 - 0.23\alpha + 10.55\alpha^2 - 21.72\alpha^3 + 30.39\alpha^4; \ \alpha = a/h$$

$$(K_I)_M = \frac{6M}{Bh^2} \sqrt{\pi a} \, Y_M$$

$$Y_{\rm M} = 1.122 - 1.4\alpha + 7.33\alpha^2 - 13.08\alpha^3 + 14\alpha^4; \ \alpha = a/h$$
